title: "HW2" author: "William Florez" date: "31 de mayo de 2017" github: https://github.com/wiflore output: html\_document: default word\_document: default ---

### HW<sub>2</sub>

#### **Question 1**

A clustering problem for could be Fixed Income - Treasuries Asset Allocation

#### The possible outcome could be:

- 1. Long run bonds looks better vs Short Term bonds
- 2. Short run bonds looks better vs Long Term bonds
- 3. Long run bonds looks and Short Term bonds looks good
- 4. Long run bonds looks and Short Term bonds looks bad

## As a predictors I could use:

CPI actual
CPI Forecast
Central Bank Rate actual
Central Bank Forecast
GDP actual
GDP Forecast
Consumer Sentiment
Private Payrolls
Dividend Yield vs Corporate Bond Yield
US vs German bonds yield spread

US 2year vs US 10year yield spread

### **Question 2**

Leading indicators

```

plot(x[c("Petal.Length", "Petal.Width")], col=kc$cluster)
points(kc$centers[,c("Petal.Length", "Petal.Width")], col=1:20, pch=20,
cex=2)
```

#This is hard to analyze and looks overfitting

To summarize

The best combination of predictors are: Petal.Length and Petal.Width

My suggested value of  $\mathbf{k}$  = 3, because we already know there are 3 classes. Evaluating ebow chart a k betweetn 20-30 could reduce error squares but looks overfitting and hard to interpreted

**How well your best clustering predicts flower type:** 96% of accuracy

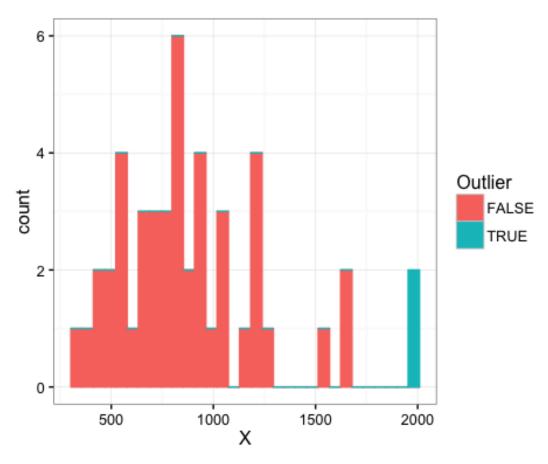

```

#There are not a clusters near to highst data crime
```

**Is the lowest-crime city an outlier?** No because the distrubution of the crime has more density to the right, so is considered a more normal data

**Is the highest-crime city an outlier?** Could be, the answer for a first insight is yes, the point is very distant from the median. I look more information clustering the data and clusters did't shows that highest-crime is near to ones of them. However is necessary a more depper analysis to determinate if is really a outlier/rare or should be consider as a event to take into account.

#### **Question 4**

I could use CUSUM with the differences of returns between a stock and its peers. For example, **the critical value** is the difference of the cumulative return of APPLE

vs its peers (AMAZON, GOOGLE, SAMSUNG, ETC) cross some point it point that something it is happening with the company and could be a signal to buy or sell subject to if cross is negative or positive.

# Question 5 - look excel file

```
library(outliers)
library(ggplot2)
library(RCurl)

data <-
getURL("https://d37djvu3ytnwxt.cloudfront.net/assets/courseware/v1/592f3b
e3e90d2bdfe6a69f62374a1250/asset-
v1:GTx+ISYE6501x+2T2017+type@asset+block/temps.txt")
data = read.table(text = data, header = TRUE)

plot(data)</pre>
```
